Assignment 1

1. Archimedes

- Principle of buoyancy

2. Leonhard Euler
(1707-1783)

- Formulated the Euler equations for ideal fluid

3. Daniel Bernoulli
(1700-1782)

- Established Bernoulli's principle relating pressure, velocity and elevation

HEART'S

Scanned with CamScanner

4- Claude Louis Navier
(1785-1836)

- Mathematical description of viscous motion fluid

5- George Gabriel Stokes
(1819-1903)

- Developped equations for viscous flow, now called N-S equations

6- Osborne Reynolds
(1842-1912)

- Introduced Reynolds number to characterize flow regimes

7. Ludwig Prandtl
(1875-1953)

- Founded modern boundary layer theory

8. Theodore von Kármán
(1881-1963)

- Advanced turbulence research and the study of vortex sheet

9. Lewis Fry Richardson
(1881-1953)

- pioneered numerical weather prediction and mathematical fluid modelling

HEA

Subject : _____ Date : ☐☐☐

10. **Lars Onsager**
(1903-1976)

contributed to the statistical mechanics and the theoritical understanding of two-dimensional turbulence
